INTEGRATION OVERVIEW

This is an overview of the TAX calculation integration between SAP Commerce and ONESOURCE Indirect Tax Determination (Determination). Thomson Reuters ONESOURCE™ Indirect Tax offers a comprehensive, cloud-based transaction tax management solution that seamlessly integrates for accurate sales tax calculation, easy document management, effortless filing and remittance.

This integration will support the following events from the SAP Commerce Platform.

- Estimate Tax Calculation Call for Carts and Orders
- Audited Tax Calculation Call for Orders
- Estimate and Audited Tax Calls for Return Requests

The solution supports the following countries for tax integration:

- United States
- Canada
- European Union countries

Prerequisites and Steps

For a successful implementation of the ONESOURCE IDT Integration with SAP Commerce, ensure you have procured the necessary packages and followed the implementation steps mentioned below:

PLATFORM	COMPONENT	DESCRIPTION
SAP Commerce	Local and Cloud environment	<ul style="list-style-type: none"> • ONESOURCE IDT Integration extensions should be added to the system setup. • Building and updating the local system to activate the extensions. • Maintenance of system configuration for various integration options including connection details and authentication.
ONESOURCE Determination	Configuration	<ul style="list-style-type: none"> • The External Company ID setup that uniquely identifies the tax request within the Thomson Reuters solution for audit, reporting, and returns purposes. • Username and Password required to set up the integration

Supported SAP Commerce versions

SAP Commerce Cloud 2011

Benefits

Integration

ONESOURCE Indirect Tax Integration extensions seamlessly connect your SAP Commerce system to ONESOURCE Determination for tax calculations and appropriate return of tax results. The extensions are developed and maintained in-house by a team of Thomson Reuters Business Systems Analysts, Developers, and Quality Assurance employees providing the most advanced tax engine determination capability and compliance returns processing globally. Our solution can be fully assimilated into your existing e-commerce systems using our open integration architecture. Tax calculation calls can be easily inserted into existing system workflows and processes to deliver real-time solutions with accurate tax results. This integration is fully embedded in the SAP Commerce architecture. It can easily be deployed in SAP Public Cloud environments and can be configured and troubleshooted on its native user interfaces like Administration Console, Backoffice and Kibana.

In case you have specific requirements, it is also possible to easily extend it just like out of the box SAP extensions by your own project resources or Thomson Reuters Professional Services team.

Determination

ONESOURCE Indirect Tax Determination enables companies to consolidate their global tax policy in one central location. All enterprise-wide applications can use a single scalable instance of Determination and still deliver business-specific tax policy across multiple-business systems. Fully integrated to all your financial applications, Determination enables the passing of transaction data from the financial system to the tax engine and returns transaction taxes in real-time for fast, reliable, and accurate indirect tax determination. We offer fully supported standard Oracle and SAP integrations, as well as custom integrations via our tax calculation web service.

Tax Certificate Manager

ONESOURCE Indirect Tax Certificate Manager is a solution for the precise tracking, validating, and governing of exemption certificates. As part of ONESOURCE, it provides integration to our ONESOURCE Indirect Tax Determination software that allows for the export of customers and exemption certificates. ONESOURCE Indirect Tax Certificate Manager improves efficiency in all aspects of the burdensome exemption certificate life cycle by reducing operating costs, mitigating risk, and increasing accuracy. ONESOURCE Indirect Tax Certificate Manager reduces audit exposure and assessments while empowering you with full control of the exemption certificate process to maintain Sarbanes-Oxley compliance.

Reporting

ONESOURCE Indirect Tax Reporting software provides fast, accurate, and flexible reporting that's fully integrated with our ONESOURCE Indirect Tax global software suite to support your global compliance, reconciliation, and data analysis processes. An easy-to-use interface provides a library of over 40 production-ready reports that can deliver the most relevant data in a few simple clicks. Drill-down capabilities provide a way for you to quickly explore the underlying data details, all the way down to the lowest level individual authority taxes. Our summary-level or detail-level reports allow you to choose the type of report data that best meets your immediate tax data needs in the most efficient way possible.

Compliance for US

Regardless of location or industry, Sales & Use Tax Compliance has the forms required to meet your needs. It provides over 600 signature-ready state and local returns that are facsimiles of the official forms. Returns and schedules include sales, seller's use, consumer's use, and rental tax forms for all applicable states, as well as the District of Columbia. Industry-specific food and beverage returns are also included. In addition, more than 70 electronic returns are available and accepted in over 25 states. Sales & Use Tax Compliance is one of the market leaders in e-filing support. Thomson Reuters continues to work directly with state taxing authorities to ensure full compliance with each state's unique electronic filing requirements. The software also goes beyond borders to include the returns required for tax compliance in Canada.

Architecture and Design Overview

In order to enable external tax calls to ONESOURCE IDT, Thomson Reuters provides following extensions to be included in your SAP Commerce setup.

For tax integration:

- **trtaxintegration:** This extension is mandatory for the tax services integration and it supports both B2C and B2B scenarios. It includes the following functionality:
 - Implements SAP's External Tax Service interface.
 - Responsible to populate request details common for B2C and B2B
 - Responsible to make the SOAP call to the external service
 - Responsible to convert the SOAP response to SAP's data structures
 - Requires and auto loads following SAP extensions: commerceservices and springintegrationlibs
- **b2btrtaxintegration:** This extension is optional and should only be used if you have a B2B Storefront. It includes the following functionality:
 - Responsible to populate request details for B2B processes
 - Requires trtaxintegration as a prerequisite
 - Requires and auto loads following SAP extension: b2bcommerce
- **trtaxintegrationbackoffice:** This extension is optional and should only be used if you would like to use Backoffice UI enhancements provided within the package. Includes the following functionality:
 - Action buttons to retrigger tax integrations for orders and return requests
 - Action buttons to recalculate totals and call the external tax service for carts and orders
 - Requires trtaxintegration as a prerequisite
 - Requires and auto loads following SAP extension : customersupportbackoffice
- **trtaxintegrationocc:** This extension is optional and should only be used if you would like to use the custom OCC endpoints provided within the package.
 - Provides REST end-points to get tax details for a cart, order and return request
 - Provides an alternative REST end-point that extends the SAP standard OCC end-point and provides extra information regarding the reason for an invalid address verification attempt
 - Requires trtaxintegration as a prerequisite
 - Requires and auto loads following SAP extension: commercewebservices

In addition, if you plan to activate address verification integration, the following extensions should also be included.

- **travsintegration:** This extension is mandatory for the address verification integration and it supports both B2C and B2B scenarios.
 - Implements SAP's External Address Verification Service interface.
 - Responsible to populate request details
 - Responsible to make the SOAP call to the external service
 - Responsible to convert the SOAP response into SAP's data structures
 - Requires and auto loads following SAP extensions: commerceservices, commercefacades and springintegrationlibs
- **travsintegrationaddon:** This extension is optional and should only be used if you have Accelerator-based storefronts on the UI layer. The extension is not needed for Spartacus UI Storefronts. (trtaxintegrationocc extension provides the same feature for Spartacus)
 - Provides extra information regarding the reason for an invalid address
 - Requires and auto loads following SAP extension: acceleratorstorefrontcommons, addonsupport

For all integration touchpoints, the call is always triggered and managed by the backend layer (SAP Commerce application servers). The solution provides no frontend (Javascript) integration with ONESOURCE IDT system.

Assumptions and Known Limitations

- ONESOURCE IDT Integration for SAP Commerce is only supported for SAP Public Cloud Deployments. Although it may be assumed that the extensions provided would work in an on-premise environment, the functionality has not been tested in an on-premise cluster.
- On storefront, the tax integration is only limited to the checkout pages. No tax calls will be triggered on other pages of the storefront.
- The tax integration supports having multiple delivery addresses in a cart/order. Since this functionality is not supported by SAP in the out-of-the-box storefronts, it is assumed that the checkout steps are customized by the client to allow the user to enter multiple delivery addresses on the cart. Details can be found in the following sections.
- Address Verification Integration only supports verification of United States addresses.

- The address verification integration is only limited to the storefront. There is no such integration in Backoffice UI as part of this integration package.

INSTALLATION

Local Environment Installation

- Decide which extensions are required for your setup. Please refer to the "Architecture and Design Overview" section of this guide.
- Extract the relevant extension folders into the "\$HYBRIS_HOME/bin/custom" folder
- Add your extensions to the localextensions.xml file. Example:
 - *<extension name='trtaxintegration' />*
 - *<extension name='b2btrtaxintegration' />*
 - *<extension name='trtaxintegrationbackoffice' />*
 - *<extension name='trtaxintegrationocc' />*
- For address verification, add the following lines to your localextensions.xml file. 'travsintegration' is mandatory for the integration while 'travsintegrationaddon' is optional.
 - *<extension name='travsintegration' />*
 - *<extension name='travsintegrationaddon' />*
- If you decide to add *travsintegrationaddon*, run the following ant command to install the addon for the required storefront extension.

Ex: ant addoninstall -Daddonnames="travsintegrationaddon" -DaddonStorefront.yacceleratorstorefront="{{myextension}}" (Replace {{myextension}} with the name of the storefront extension in your setup)

- Build your system with "ant all"
- Update your system with "ant updatesystem".

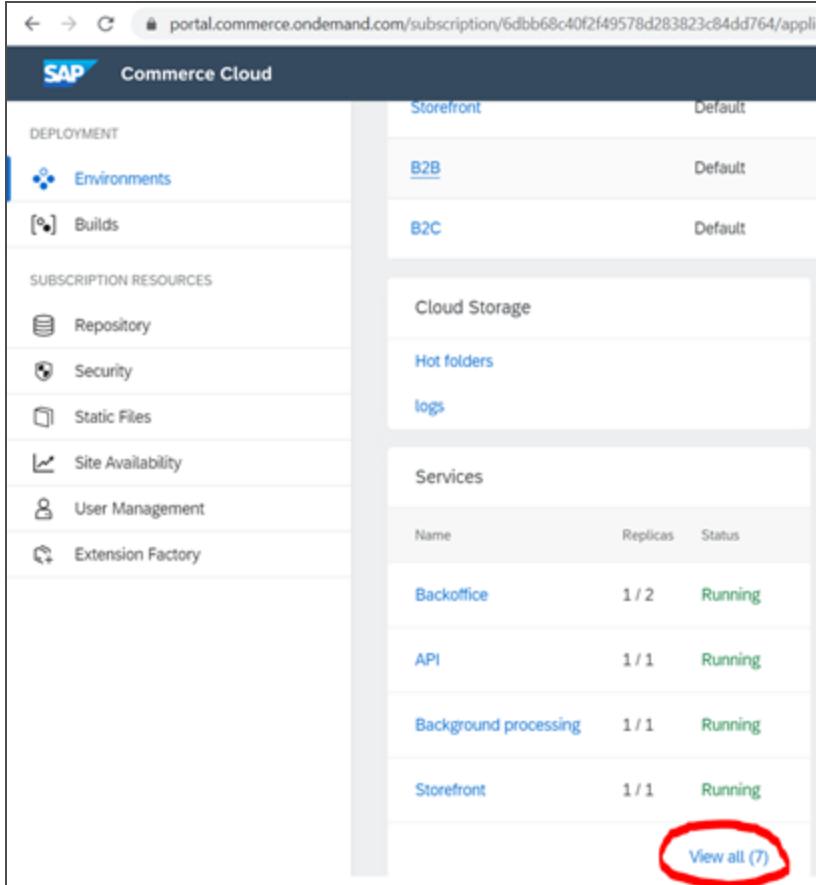

Activating External Tax Calls

For ONESOURCE IDT external tax call to ONESOURCE IDT to be triggered in the system, the following prerequisites should be met:

- External Tax Calling should be activated for the base store (BaseStore.externalTaxEnabled should be true)
- External Company ID should be defined in system configuration. Check “Base Store Specific Configuration” section for details on how to differentiate External Company ID for each Base Store.
- The cart should have at least a delivery address and a delivery mode for the tax call to be triggered.
- In case of a pickup in-store scenario where delivery addresses are not relevant, a point of service address should already be maintained.

SAP Public Cloud Environment

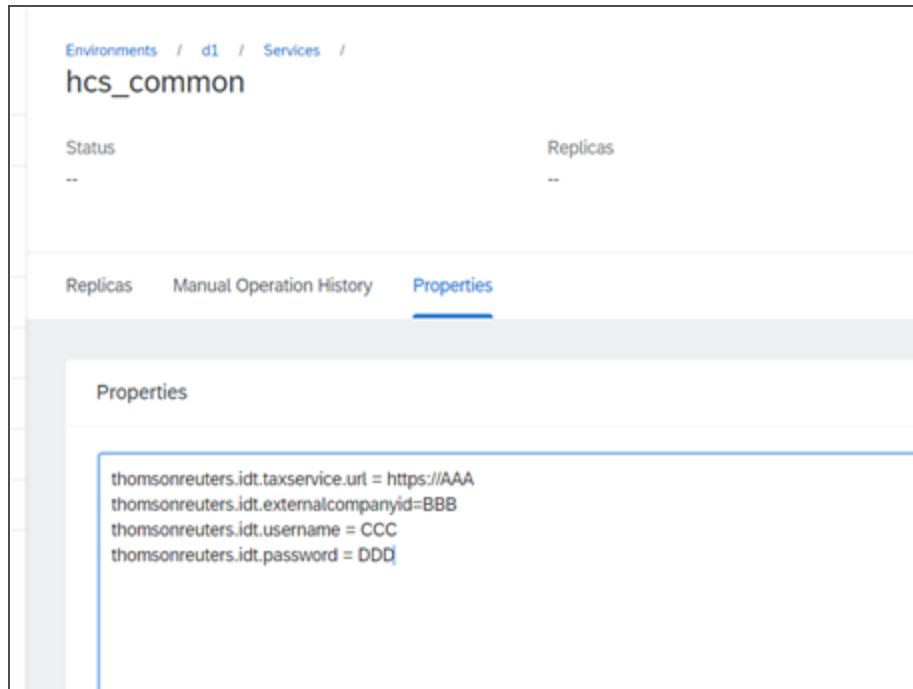

- Make sure you committed extension folders in your code repository
- Update your manifest.json file to include the extensions in your setup. This file should be located in \$HYBRIS_HOME folder. Also, make sure that your configuration properties described in section Configure SAP Commerce for ONESOURCE IDT Integration are included in your setup.
- Since it is a security best practice to not to keep any sensitive data in the code repository, you can provide the username and password necessary to connect to ONESOURCE IDT on the SAP Commerce Cloud Portal. Please carry out the following steps:
 - Login to <https://portal.commerce.ondemand.com/> with your SAP credentials
 - Under Environments choose your environment
 - Click “View All” link in “Services” tile of your environment

The screenshot shows the SAP Commerce Cloud deployment interface. The left sidebar includes sections for Deployment (Environments, Builds), Subscription Resources (Repository, Security, Static Files, Site Availability, User Management, Extension Factory), and a Cloud Storage section with sub-options for Hot folders and logs. The main content area displays a table of services with columns for Name, Replicas, and Status. The services listed are Backoffice (1/2 replicas, Running), API (1/1 replicas, Running), Background processing (1/1 replicas, Running), and Storefront (1/1 replicas, Running). A red circle highlights the 'View all (7)' link at the bottom of the service table.

Name	Replicas	Status
Backoffice	1 / 2	Running
API	1 / 1	Running
Background processing	1 / 1	Running
Storefront	1 / 1	Running

- Choose “hcs_common” and “Properties” tab
- Provide your username and password in the following format:
 - thomsonreuters.idt.taxservice.url = https://AAA
 - thomsonreuters.idt.externalcompanyid=BBB
 - thomsonreuters.idt.username = CCC
 - thomsonreuters.idt.password = DDD

The screenshot shows the SAP HANA Cloud Platform Services interface. The URL in the address bar is `Environments / d1 / Services / hcs_common`. The service name is `hcs_common`. The status is shown as `--` for both Status and Replicas. Below the status, there are three tabs: `Replicas`, `Manual Operation History`, and `Properties`. The `Properties` tab is selected and highlighted with a blue underline. On the left, a sidebar titled `Properties` lists the following configuration properties:

```
thomsonreuters.idt.taxservice.url = https://AAA
thomsonreuters.idt.externalcompanyId=BBB
thomsonreuters.idt.username = CCC
thomsonreuters.idt.password = DDD
```

- Click “Save” button and then “Apply Configurations”. Your application servers will be restarted with the provided values.

BUSINESS PROCESS DESCRIPTION

Main Business Processes

Checkout

During a checkout process both in B2C and B2B storefronts, several estimation tax requests are sent to the Determination Engine in order to calculate the exact sales tax. After each call Determination response is read, converted to SAP format and persisted on the cart object. The result for the total tax value is displayed in the “Order Summary” section of the next checkout step.

Order Summary	
Ship To:	Mark Jackson 2733 Earnhardt Drive, Louisville, Kentucky, 40299, United States +1 20 9999 3471
 T-Shirt Men Playboard Raster SS red XL	\$30.58
Item Price: \$30.58	
QTY: 1	
Style: red	
Size: XL	
Subtotal:	\$30.58
Delivery:	\$9.99
Tax:	\$1.83
ORDER TOTAL	 \$42.40

Order Processing

If the order fulfillment process is managed by SAP Commerce, it is possible to do the tax auditing for ONESOURCE Determination. On the other hand, if the order is sent to an external system for processing, this step may not be necessary.

Once the order is saved in SAP Commerce, an Order Business Process is triggered associated with this order which orchestrates all the tasks that need to be carried out for fulfilling the order. The major steps include e-mail notifications, assignment of orders to warehouses, warehouse process, tax postings and payment processing.

In SAP's standard process flow, tax posting happens right after the warehouse process is completed and shipment is confirmed. This is also the default and the preferred method in ONESOURCE IDT integration. On the other hand, a modified process flow is provided as a part of the integration package which makes it possible to shift tax posting right after the order save and send updates in case any changes occur further in the process flow. Please check section "Audit Calls in Orders" of this document for details.

Compared to the calls in the checkout process at the tax posting step, the following differences should or might be observed in the tax calls related with an order:

- The tax call is audited, which means the document is persisted on the ONESOURCE Determination database.
- The tax call request is prepared with the last version of the order. Any change that might happen on the order from the first save is taken into account such as partial cancellations, order quantity updates or pricing / shipment cost changes.

Returns

If the return process is managed by SAP Commerce, it is possible to do the tax auditing for ONESOURCE Determination. On the other hand, if the returns process is not activated in SAP Commerce or the return is transferred to an external system for processing, this step may not be necessary.

Initiating the return request may happen in two channels: Storefront via returns self-service page or Customer Support agent using Customer Service Backoffice role. In both cases, a Return Request document is created in SAP Commerce and a Return Business Process is started in the background.

As part of the integration package a custom return process is provided which allows you to make an estimation call to ONESOURCE Determination once the return is approved by the customer service. As the process advances, the goods arrive to the warehouse and once the acceptance of the goods is completed in the warehouse, this time an audit call is sent to post the realized taxes and a record for the return request is also created in the Determination Database.

At both estimation and audit calls, the taxes are calculated and persisted on the return request document.

Please note that in Self-Service Returns process, the external tax calculation is not triggered by the SAP's standard flow and no tax value is presented to the user at the time of return request creation. For this reason, all the tax calculations are happening in the business process which runs as a background process. On the other hand, provided that you are using Spartacus UI for your storefront, you can make use of the custom OCC endpoint provided as a part of this integration package to present already calculated tax values in your Return Request Details page under My Account section of your site. Please check the details in "Support for Spartacus UI and Omni Commerce Connect (OCC) REST API" section of this document.

Other Features:

Net vs Gross Pricing

The ONESOURCE Determination integration supports both net pricing and gross pricing options in documents. AbstractOrderModel.net field is taken into account while preparing the tax request. In the request XML:

- If the cart/order runs on net pricing
 - <CALCULATION_DIRECTION> is set as "F – Forward"
 - <GROSS_AMOUNT> tag is used for the item amount

- If the cart/order runs ongross pricing
 - <CALCULATION_DIRECTION> is set as “R – Reverse”
 - <GROSS_PLUS_TAX> tag is used for the item amount

Taxes for the Delivery Cost

The ONESOURCE Determination integration supports tax calculation for delivery costs. This can happen in two different ways:

- **Single delivery cost as an additional item:** For each tax request an additional item is added to the order that represents the delivery cost.
 - AbstractOrderModel.deliveryCost field is used as the amount for this item.
 - The product/commodity code for the delivery cost item is determined by the “thomsonreuters.idt.request.shipping.productcode” system property.
 - Quantity will always be 1.
 - The tax results are kept as TaxValue’s in cart/order header (AbstractOrderModel.totalTaxValues)
- **Distributed delivery cost per item:** For each delivery related item in cart/order, an additional item is inserted in the request.
 - AbstractOrderModel.deliveryCost field is distributed to each delivery item proportionally based on their item value.
 - The product/commodity code and quantities are maintained the same as the first method.
 - The delivery tax items are associated with their original items with a <RELATED_LINE_NUMBER> tag so that the same tax calculation logic is applied both to the cart/order item and its respective delivery.
 - Pickup in store items are excluded from this logic since they are not delivery related. No delivery item is created for them and they are not taken into account in delivery cost distribution.
 - Although the delivery costs are associated with the item, the tax results are kept as TaxValues on header rather than in the item (AbstractOrderModel.totalTaxValues). A prefix (thomsonreuters.idt.response.shipping.prefix) is added to the tax code (Ex: ForItem-0-) to differentiate the delivery cost tax values resulting from different items. The summarization options valid throughout the system also apply for the delivery cost taxes.

Single delivery cost method is the default method in delivery cost tax calculation and should be preferred in most cases. On the other hand, the distributed delivery cost method allows more accurate tax calculation but comes with its own complexity with increased number of TaxValue's .

Summarization Options for Tax Authority Details

The ONESOURCE Determination response for a typical tax call includes details of all the Tax Authorities (Tax Blocks) associated with a line . Keeping this level of detail in SAP Commerce documents may result with having several tax value lines for each item in the cart/order and on the header (in case shipping cost exists). For this reason, it is possible to apply a summarization operation to these tax values and group them by using one of the available criteria, hence reducing the number of tax value lines in carts/orders in SAP Commerce.

Example: Suppose the following taxes are calculated and returned by the Determination System for a cart having no delivery cost. You will see result of each different summarization option in the relevant section below.

CART ENTRY NO:	TAX AUTHORITY	TAX VALUE (\$)	ERP TAX CODE	AUTHORITY TYPE	ZONE LEVEL
1	A1	2.00	T1	State Sales/Use	State
1	A2	3.00	T1	County Sales/Use	County
2	A1	4.00	T1	State Sales/Use	State
2	A2	5.00	T1	County Sales/Use	County
2	A3	6.00	T2	County Sales/Use	County
3	A1	7.00	T1	State Sales/Use	State
3	A2	8.00	T1	County Sales/Use	County
3	A3	9.00	T1	County Sales/Use	County
3	A4	10.00	T3	County Rental	County

You can choose one of the following options for summarization and set to `thomsonreuters.idt.response.summarization` system property has to be maintained on the system to activate summarization. There are three different possible options for summarization:

- **SummaryByErpCode:** The tax values are grouped by `<TAX><ERP_TAX_CODE>` tag in the response. In other words, the tax values having the same ERP code are consolidated into a single tax value.

Ex: Here is the tax value structure you'll find in the cart in SAP Commerce for the example above:

CART ENTRY NO:	TAX CODE	TAX VALUE (\$)
1	T1	5.00
2	T1	9.00
2	T2	6.00
3	T1	24.00
3	T3	10.00

- **SummaryByAuthorityAndZone:** The tax values are grouped by <TAX><AUTHORITY_TYPE> tag in the response. In other words, the tax values having the same authority types are consolidated into a single tax value.

Ex: Here is the tax value structure you'll find in the cart in SAP Commerce for the example above:

CART ENTRY NO:	TAX CODE	TAX VALUE (\$)
1	State Sales/Use	2.00
1	County Sales/Use	3.00
2	State Sales/Use	4.00
2	County Sales/Use	11.00
3	State Sales/Use	7.00
3	County Sales/Use	17.00
3	County Rental	10.00

- **FullDetails:** The tax values are not grouped at all and converted to TaxValue's as is.

Ex: Here is the tax value structure you'll find in the cart in SAP Commerce for the example above:

CART ENTRY NO:	TAX CODE	TAX VALUE (\$)
1	A1	2.00
1	A2	3.00
2	A1	4.00

2	A2	5.00
2	A3	6.00
3	A1	7.00
3	A2	8.00
3	A3	9.00
3	A4	10.00

Buyer and Seller Registrations

For installations supporting Canada and European Union, it is necessary to maintain and send buyer and seller registration numbers in tax calls.

- Seller Registration Numbers: “thomsonreuters.idt.registration.seller” system configuration has to be set as true. Multiple registration numbers can be defined for a base store in Backoffice. For this reason, a custom field is introduced to the Base Store model (tridtTaxRegistrationNumbers).
- Buyer Registration Numbers: “thomsonreuters.idt.registration.buyer” system configuration has to be set as true. Multiple registration numbers can be defined for a B2B Unit in Backoffice. For this reason, a custom field is introduced to the B2BUnit model (tridtTaxRegistrationNumbers).

Sending INCOTERMS

If b2btrtaxintegration extension is active, it is possible to send INCOTERMS in a tax request. There are two prerequisites for this feature:

- “thomsonreuters.idt.request.b2b.senddeliverymodeasincoterms” configuration item should be set as true.
- A new field is created on DeliveryMode model (tridtIncoterms). By using this field, an INCOTERM value can be assigned to each delivery mode. The value for this field cannot be longer than 10 characters. If this field is empty, first 10 characters of the DeliveryMode.code field is used.

Audit Calls in Orders

You are provided with two options for the timing of the ONESOURCE Determination tax audit call in the order process.

- **Auditing After Shipment:** This is the default setting which is also supported by the SAP's out-of-the-box order business process (order-process). In this approach, no audit tax call is made right after the order is saved on the database (after a successful checkout) and the audit tax call is postponed after the warehouse process is complete. When no open consignment remains for an order and at least one consignment is in SHIPPED status, the "Tax Posting" business process step is activated and a request is prepared just like the ones already sent in the checkout process, but this time with the following differences:
 - <IS_AUDITED> tag value is set as true.
 - Always the last version of the order is taken as reference when preparing the request. This means if there are any partial cancellations happened in the order lifecycle, updated quantities and amounts are sent to the Determination Engine. For this reason, the calculated tax value in the audit call may differ from the estimation calls already happened in the checkout.
 - Please note that if all items are fully cancelled and nothing remains to be shipped, no audit tax call happens, since "Tax Posting" business process step is never reached in the order business process. In this case, no corrections need to be posted to the Determination engine, since no audit call were made previously for this order.
 - In order to be consistent with the estimation calculations in checkout, the <INVOICE_DATE> tag which is the basis for the tax calculation date, is set as the order date (AbstractOrderModel.date field), not the actual posting date.
 - In order to have this feature activated, you should keep "thomsonreuters.idt.request.audit.auditafterdelivery" system configuration as true which is the default value.

- **Auditing After Order Placement:** If your business and accounting practices requires making an audited tax call immediately after order, you can achieve this feature by setting "thomsonreuters.idt.request.audit.auditafterdelivery" system configuration as false.
 - The business process definition running behind the orders should also be updated. A sample process definition is already provided in this package. You can find the definition in an impex format in trtaxintegration extension under resources / business_processes folder in tridt-order-business-process.impex file.
 - This impex will not be automatically uploaded during system update / initialization and should be manually imported if necessary. Please note that this definition is not intended to be directly used in production environments and were provided just as an example. You should adapt this definition to your own order business process keeping in mind the following points:
 - The example process introduces two steps: tridtTaxAuditUpdateAfterPartialCancellation and tridtTaxAuditVoidAfterFullCancellation which handles audit updates in case of a partial or full cancellation.
 - Look for actions that have "transition name='CANCELLED'" or wait nodes where "choice id='cancelled'" in your original process definition and make sure the flow is directed to the new steps above after those transitions depending on the nature of the cancellation.
 - Although the postTaxes action after successful completion of "verifyOrderCompletion" step is not necessary in this scenario, you can keep the process as is, since the code will decide to trigger a request based on the "thomsonreuters.idt.request.audit.auditafterdelivery" value.
 - If you created a new business process for this purpose, don't forget to update your Base Store settings in Backoffice to activate the new definition. (BaseStoreModel. submitOrderProcessCode field)

Recalculation of Cart/Order Totals

In the lifecycle of an order, recalculation of the totals, including total tax, might be performed several times starting with the checkout process, until the completion of the order process. Typical events that trigger a recalculation might be adding a product to cart, changing quantities, applying promotions or a partial cancellation that results a refund action. Technically speaking, DefaultCalculationService is the default class which is responsible for executing the business logic for this action. In this business logic, there are two important factors that need to be considered from tax point of view:

- The underlying assumption in this class is that the taxes are determined internally from TaxRows and for tax calculation. For this reason, it doesn't call the ExternalTaxService interface which is responsible to trigger ONESOURCE Determination integration. In checkout process this problem is handled by calling the external tax service immediately after recalculation and overriding the total tax value afterwards. But in other parts of the system, for example the "Recalculate Orders" button in Orders page of Backoffice UI, this additional external tax call functionality is missing.
- In each recalculation attempt, cart/order header tax values (AbstractOrderModel.totalTaxValuesInternal and totalTaxValues fields) are reconstructed by gathering all item tax values and finding subtotals of each tax code. This logic contradicts with SAP's external tax logic where totalTaxValuesInternal field is used to keep delivery related tax values (Check DefaultApplyExternalTaxesStrategy interface for details). For this reason, if a recalculation happens with calling external tax service, the header tax values in cart/order will be corrupted.

In order to cope with these challenges, following functionality is provided as part of this integration package:

- A custom implementation for CalculationService interface, TridtCalculationService, is provided that deactivates the unwanted effect of accumulation of item tax values in the header. Please keep in mind that, the service will not be active immediately since spring bean definitions are missing. This is intentional, since CalculationService is a core platform functionality which might already be enhanced. For this reason, the logic in TridtCalculationService should be manually merged to your implementation.
- Two custom backoffice actions are provided in trtaxintegrationbackoffice extension that replace system standard recalculation buttons in Orders page. Please check "Backoffice Enhancements" section for details.

Note: In your custom customizations, if you have to call CalculationService interface, please consider calling ExternalTaxesService right after in order to update tax information for the new version. The interface will decide to make an estimation or an audit call depending on the status of the order and update Determination records if necessary. OrderCancelPaymentServiceAdapter is a good example for such a custom implementation, where clients usually apply custom business logic to handle the refund process after a cancellation and might require order recalculation.

Returns Process

In order to efficiently manage taxes in your return processes, return business process definition has to be customized.

- Similar to orders, an example definition (tridt-return-process) is already provided in this package. You can find the definition in an impex format in trtaxintegration extension under resources / business_processes folder in tridt-return-business-process.impex file.

- This impex will not be automatically uploaded during system update / initialization and should be manually imported if necessary. Please note that this definition is not intended to be directly used in production environments and were provided just as an example. You should adapt this definition to your own return business process keeping in mind the following points:
 - There is an extra process step called taxCalculateAction, which is responsible to make an estimation tax call for an approved return request. The estimation results are kept in the Return Request document for reference.
 - Compared to original process definition, tridt-return-process executes the tax posting (taxReverseAction step) before the payment refund process but right after the goods acceptance. This way tax values can be taken into account when refunding the return in the payment processing step. The tax call at this step is an audit call which allows new records to be created in ONESOURCE Determination.
- If you created a new business process for this purpose, don't forget to update your Base Store settings in Backoffice to activate the new definition (BaseStoreModel.createReturnProcessCode field).

The data model for Return Requests were extended with custom fields in order to be able to hold detailed information just like carts and orders. Here are the custom fields in ReturnRequestModel:

- tridtTaxValuesInternal : Similar to the counterpart in AbstractOrderModel (totalTaxValuesInternal), this field is not visible in Backoffice UI and it keeps the string representations of TaxValue objects assigned to ReturnRequest header. These tax values are the tax calculated for the delivery cost.
- tridtTaxValues: Similar to the counterpart in AbstractOrderModel (totalTaxValues), this is a dynamic field that shows the tridtTaxValuesInternal as a Collection in Backoffice UI.
- tridtTaxPostingDate: If the value of this field is used as the base date for tax calculation. The value of this field is determined according to "thomsonreuters.idt.returns.usegoodsacceptancedate" system configuration property. If this property is true, the field is set at the time when taxReverseAction step is executed which corresponds to the goods issue processing date. If property is false, the field is kept empty and the associated order's date (AbstractOrderModel.date) is used as the base date for tax calculation.

Here are the custom fields in RefundEntryModel:

- tridtTaxValuesInternal : Similar to the counterpart in AbstractOrderEntryModel (taxValuesInternal), this field is not visible in Backoffice UI and it keeps the string representations of TaxValue objects assigned to ReturnRequest header. These tax values are the tax calculated for the delivery cost.
- tridtTaxValues: Similar to the counterpart in AbstractOrderEntryModel (taxValues), this is a dynamic field that shows the tridtTaxValuesInternal as a Collection in Backoffice UI.

Summarization options that are valid for the order's base store is also valid for the return request document. Please check "Summarization Options for Tax Authority Details" section for details.

Note: SAP standard refund amount calculation logic does not include return request tax values into the total refund amount (class CaptureRefundAction). This implementation is not included in this package since the payment domain is out of this product's scope. It is advised that the clients who would like to use this functionality, extend refund calculation logic to take taxes into account when calculating the totals.

Refunding the Delivery Cost in Returns

As per standard SAP Commerce logic, it is possible to refund the delivery cost in a return (Refund Delivery Cost field on Return Request). In this case, the tax calculation needs to be carried out for the delivery cost. In this process:

- Whatever delivery cost taxing method is chosen for carts and orders (Header charges vs item charges), the same method applies for the return request documents. Please check "Taxes for the Delivery Cost" section for details.
- In case of a partial return, items that are not being returned are also kept in the tax request, but their quantities are set to zero. If delivery cost is being refunded and item distribution for delivery cost strategy is activated, these zero quantity items may be referred by delivery cost items carry charges. This is necessary to calculate the exact delivery cost tax amount in a return request just like the cart/order.

Backoffice Enhancements

The enhancement in Backoffice UI within the ONESOURCE Determination Integration package is listed as follows:

Backoffice Administrator Role

- "Recalculate order totals" and "Calculate with promotions" action buttons in Orders page are deactivated if external taxing is activated in the base store assigned to the order.
- Two new buttons are introduced instead of the two actions above as "Recalculate order totals with external tax" and "Calculate with promotions with external tax" that will call Determination and update tax values in the order and respective order entries after executing out-of-the-box calculation logic.

Customer Support Agent Role

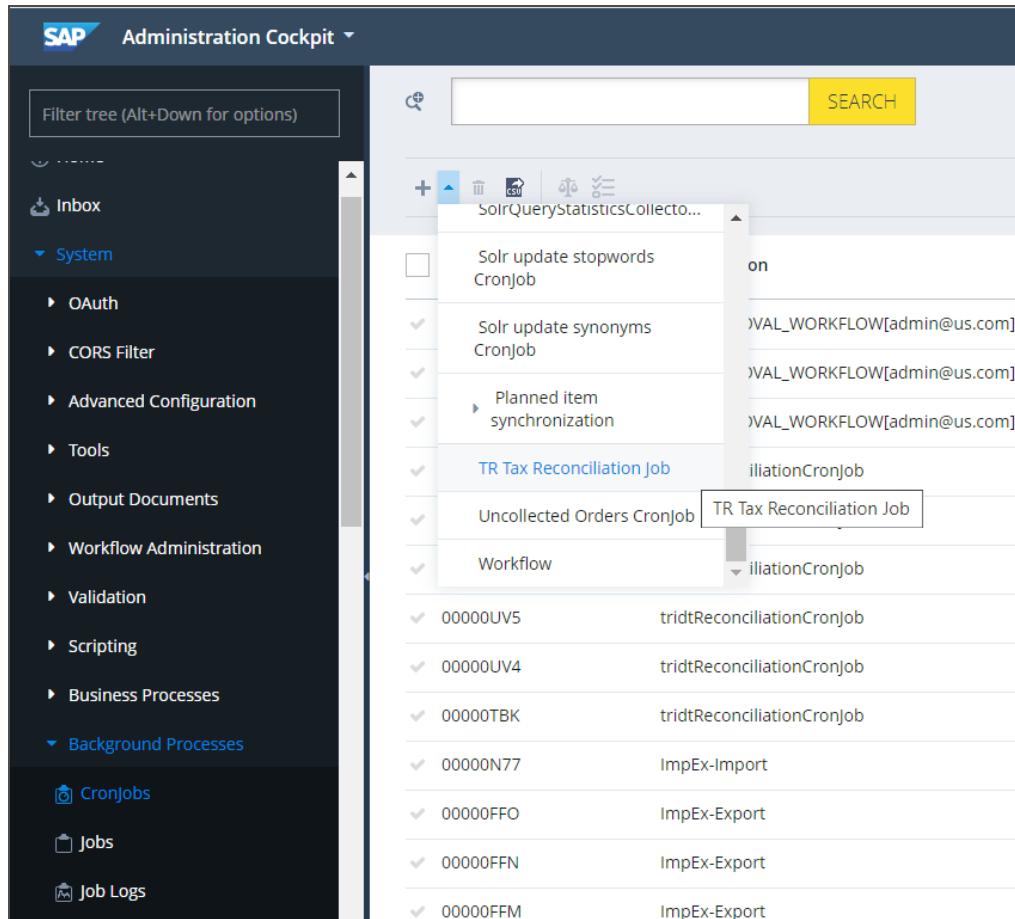

- The following actions existing on the Order Details page are deactivated as they are not relevant for this integration.
 - Manual Tax Void Action
 - Manual Tax Commit Action
 - Manual Tax Requote Action
 - Manual Delivery Cost Commit Action
- The following actions are added on the Order Details page by the ONESOURCE Determination integration package.
 - Refresh Taxes Action (If the order is audit relevant, the request will be audited in Determination, otherwise it will be an estimation call. All Tax Values in the order and respective order entries will be refreshed and the total tax field in the order header will be recalculated.)
- Following actions existing on the Return Request Details page are deactivated as they are not relevant for this integration
 - Manual Tax Reverse Action
- The following actions are added on the Return Request page by the ONESOURCE Determination integration package..
 - Refresh Taxes Action (The system will send an audit call to the Determination System. Tax fields in the return request and refund entries will be recalculated.)

Reconciliation Report

The integration package provides a reconciliation report that can be used in month-end closing. By running a cronjob, users can download a list of audited orders and returns in a specified period for a specified base store and compare the results with ONESOURCE Determination reports in order to identify inconsistencies between two systems.

In order to initiate the cronjob:

- In Backoffice UI, go to System/ Background Processes / Cronjobs
- Create a new cronjob by clicking on the little triangle near the "Create new Cronjob" button and select TR Tax Reconciliation Job.

The screenshot shows the SAP Administration Cockpit interface. The left sidebar contains a navigation tree with categories like System, Business Processes, and Background Processes. The main area displays a list of cron jobs. One job, 'TR Tax Reconciliation Job', is highlighted with a yellow box.

Job Name	Description
Solr update stopwords Cronjob	on
Solr update synonyms Cronjob	VAL_WORKFLOW[admin@us.com]
Planned item synchronization	VAL_WORKFLOW[admin@us.com]
TR Tax Reconciliation Job	ilationCronjob
Uncollected Orders Cronjob	TR Tax Reconciliation Job
Workflow	ilationCronjob
00000UV5	tridtReconciliationCronjob
00000UV4	tridtReconciliationCronjob
00000TBK	tridtReconciliationCronjob
00000N77	ImpEx-Import
00000FFO	ImpEx-Export
00000FFN	ImpEx-Export
00000FFM	ImpEx-Export

- Select a base store, period start and end dates for the interval. Then choose `tridtReconciliationCronJob` for job definition.
 - When selecting dates, please keep in mind that, the report will only consider the date portion of the selected value. The times will be adjusted to the start of the day for the period start and end of the day for the period end after the cronjob is started.
 - Since the dates are kept in the system timezone in SAP Commerce, the date chosen by the user is assumed to be in the system timezone.

Ex: For a user in EST (browser timezone) on a system in CST, Oct 1, 2020 10:49:16 AM EST is adjusted as Oct 1, 2020 12:00:00 AM CST for a period start date.

Create Reconciliation CronJob

CREATE

Base Store:
US Apparel Store

Period Start:

Period End:

Job definition:
tridtReconciliationCronJob

- After clicking on Done, a new cronjob will be created but not run yet. In order to run the job, find the newly created cronjob and start it.

tridtReconciliationCronJob : 00000X6G - UNKNOWN - UNKNOWN

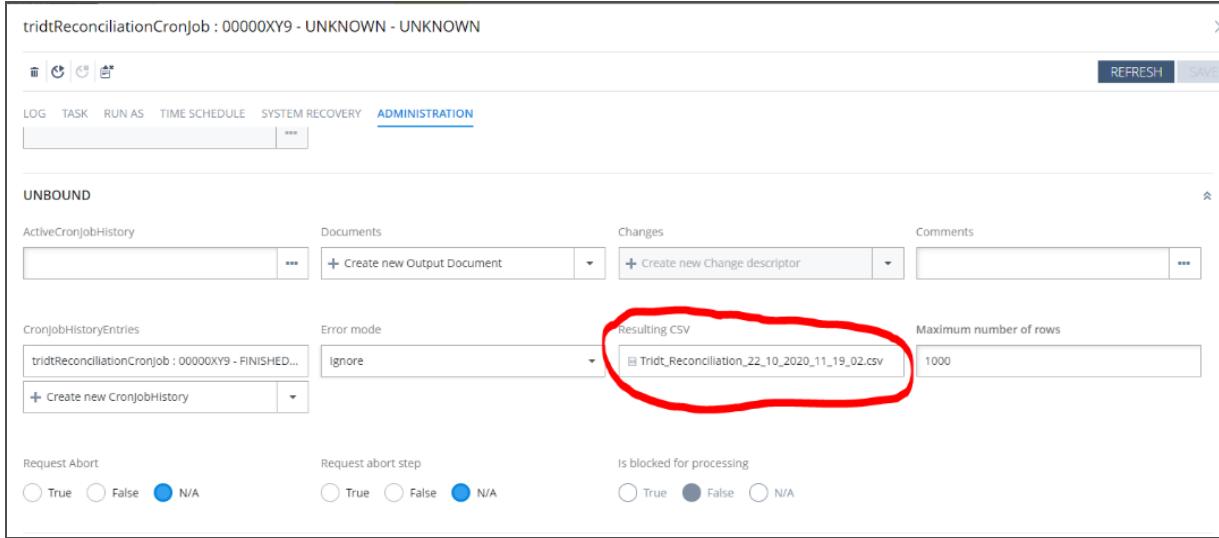

LOG **TASK** **RUN AS** **TIME SCHEDULE** **SYSTEM RECOVERY** **ADMINISTRATION**

ESSENTIAL

Code	Current status
00000X6G	NEW
Timetable	Last start time

- If the job can not find any orders or returns for the given parameters, the result of the cronjob will be set as ERROR.

CONFIGURATION OPTIONS

It is possible to change the default integration behavior by providing certain system properties in local.properties file for local installations and manifest.json file SAP Public Cloud Systems. Each option is described below in detail:

CONFIGURATION KEY	DESCRIPTION	CAN BE BASE STORE SPECIFIC?
Connection		
thomsonreuters.idt.taxservice.url	The value will be provided by Thomson Reuters Default value: Empty	No
thomsonreuters.idt.externalcompanyid	The value will be provided by Thomson Reuters. Default value: Empty	Yes
thomsonreuters.idt.username	The value will be provided by Thomson Reuters Default value: Empty	No
thomsonreuters.idt.password	The value will be provided by Thomson Reuters Default value: Empty	No
thomsonreuters.idt.hostsystem	String that represents the role of the system. Ex: DEV, QA, PROD etc. Default value: DEV	No
thomsonreuters.idt.callingsystemnumber	String that represents the calling system sending the transaction. Can be differentiated in case of multiple tenants in a single system Default value: 01	No
thomsonreuters.idt.connection.retry.delay	Waiting duration between retry attempts in milliseconds Default value: 1000	No

thomsonreuters.idt.connection.retry.attempts	Number of retries in case of a connection error Default value: 3	No
Address		
thomsonreuters.idt.address.sendGeoCode	If it is true, geocode will be included in the request. The value that will be sent as geocode will depend on thomsonreuters.idt.address.postalcodeIncludesGeoCode and thomsonreuters.idt.address.geocode parameters. Default value: false	Yes
thomsonreuters.idt.address.postalcodeIncludesGeoCode	If it is true, XXXXX-YYYY format is expected on Address.postalCode field: where the first part will be used for <POSTAL_CODE> tag and the second part will be used for the <GEOCODE> tag in the request XML. If no hyphen is detected, the entire string will be used for the <POSTAL_CODE> tag and <GEOCODE> will be left empty. If it is false Address.postalCode field is used for the <POSTAL_CODE> tag In this case. If thomsonreuters.idt.address.sendGeoCode is true, thomsonreuters.idt.address.geocode will be used to generate <GEOCODE> content in the request XML. Default value: false	Yes

thomsonreuters.idt.address.geocode	<p>If it is true, XXXXX-YYYY format is expected on Address.postalCode field: where the first part will be used for <POSTAL_CODE> tag and the second part will be used for the <GEOCODE> tag in the request XML. If no hyphen is detected, the entire string will be used for the <POSTAL_CODE> tag and <GEOCODE> will be left empty.</p> <p>If it is false Address.postalCode field is used for the <POSTAL_CODE> tag in this case. If thomsonreuters.idt.address.sendGeoCode is true, thomsonreuters.idt.address.geocode will be used to generate <GEOCODE> content in the request XML.</p> <p>Default value: false</p>	Yes
thomsonreuters.idt.address.county	<p>Any String typed fieldname (SAP standard or custom) on “Address” type can be provided as a parameter for this property</p> <p>Default value: district</p>	Yes
thomsonreuters.idt.address.city	<p>Any String typed fieldname (SAP standard or custom) on “Address” type can be provided as a parameter for this property</p> <p>Default value: Emptytown</p>	Yes
thomsonreuters.idt.address.district	<p>Any String typed fieldname (SAP standard or custom) on “Address” type can be provided as a parameter for this property</p> <p>Default value: district</p>	Yes

thomsonreuters.idt.request.address.sendorderacceptanceaddress	<p>If set to true, address details will be determined based on the tridtOrderAcceptanceAddress field on the Base Store. Any String typed fieldname (SAP standard or custom) on “Address” type can be provided as a parameter for this property</p> <p>If the field is empty, the ship-from address will be used as the order acceptance address.</p> <p>Default value: townfalse</p>	Yes
thomsonreuters.idt.request.address.sendorderoriginaddress	<p>In B2C, if set to true, bill-to address will be copied to the order-origin address. In case bill-to is not set at the time of the tax call, ship-to address will be used instead.</p> <p>In B2B, if set to true, address details will be populated based on the B2BUnit.contactAddress field. If the field is empty, similar to B2C, bill-to or ship-to address will be copied to order origin address.</p> <p>Default value: false</p>	Yes
thomsonreuters.idt.request.address.sendsellerprimary	<p>If set to true, address details will be determined based on the tridtOrderAcceptanceAddress field on the Base Store. If the field is empty, the ship-from address will be used as the seller primary address.</p> <p>Default value: false</p>	Yes

thomsonreuters.idt.request.address.sendbuyerprimary	<p>In B2C, if set to true, bill-to address will be copied to the buyer primary address. In case bill-to is not set at the time of the tax call, ship-to address will be used instead</p> <p>In B2B, if set to true, address details will be determined based on the B2BUnit.contactAddress field. If the field is empty, similar to B2C, bill-to or ship-to address will be copied to buyer primary address.</p> <p>Default value: false</p>	Yes
Product Code / Commodity Code		
thomsonreuters.idt.request.item.sendCommodityCode	<p>If set to true, <COMMODITY_CODE> tag will be sent for each line item. <PRODUCT_CODE> tag will be sent otherwise.</p> <p>Default value: false</p>	Yes
thomsonreuters.idt.request.item.taxcode.enhancedsearch.producthierarchy.enabled	<p>If set to true, an enhanced search will be triggered to find product/commodity code starting from the product in cart and going upper levels if not found. E.g. First check the size variant's product master for a product/commodity code, if not found check the associated color variant and if not found check the base model.</p> <p>Default value: false</p>	Yes

thomsonreuters.idt.request.item.taxcode.enhancedsearch.categoryhierarchy.enabled	If set to true and if the search in product hierarchy doesn't provide any results, then an enhanced search will be triggered to find product/commodity code starting from the first level category and going upper levels if not found. E.g. First check the immediate categories assigned to the product in cart, if not found check the parent categories until a value is found. Default value: false	Yes
thomsonreuters.idt.request.item.taxcode.fallbackCode	If no value is found for product/commodity code, this text will be used as a fallback code. Default value: Empty	Yes
Delivery Cost		
thomsonreuters.idt.request.shipping.productcode	This value will be used as the default product/commodity code for the delivery cost item. Default value: FREIGHT	Yes
thomsonreuters.idt.request.b2b.senddeliverymodeincoterms	If set to true, an incoterm value will be added to the header and items (in case there is a specific delivery mode in the item). Please check Sending INCOTERMS section for details. Default value: false Only valid for B2B scenario	Yes

thomsonreuters.idt.request.shipping.sendmultipledeliverycostitems	If activated, a separate delivery cost item will be included in the request for each delivery related item in cart/order. Delivery cost on the header will be distributed to each delivery item based on the respective item value. Default value: false	Yes
thomsonreuters.idt.response.shipping.prefix	This prefix will be used for naming every delivery cost related tax value if item charges scenario is activated. Please visit Taxes for the Delivery Cost section for details Default value: ForItem-	Yes
Tax Auditing		
thomsonreuters.idt.request.audit.auditafterdelivery	If set to true, tax audit call order delivery status should be SHIPPED as a prerequisite to trigger a tax audit call. If set to false, a tax audit call will be performed as soon as the cart is converted to an order. Default value: true	Yes
Canada and EU specific		
thomsonreuters.idt.registration.seller	If activated, any registration number maintained in the base store will be included in the request as seller registration numbers. Default value: false	Yes

thomsonreuters.idt.registration.buyer	If activated, any registration number maintained in the B2BUnit will be included in the request as buyer registration numbers. Default value: false Only valid for B2B scenario	Yes
Tax Response Summarization		
thomsonreuters.idt.response.summarization	The value should be either of these three values: - SummaryByErpCode - SummaryByAuthorityAndZone - FullDetails Details are described in section Summarization Options for Tax Authority Details Default value:SummaryByAuthorityAndZone	Yes
Returns		
thomsonreuters.idt.returns.usegoodsacceptancedate	If set to true, goods acceptance date is sent as the base date for return request tax calculation. If set to false, the date field for the associated order is used instead. Default value: false	Yes
Service Call Fallback		

thomsonreuters.idt.fallback.fallbackoncart	If activated, for cases where ONESOURCE Determination service is not reachable or integration call could not be completed due to a system error, a fallback rate will be used as an alternative to avoid an exception in checkout . Default value: false	Yes
thomsonreuters.idt.fallback.fixedpercentage	The fixed-rate for the fallback process. Default value: Empty	Yes
Logging		
thomsonreuters.idt.detailedlogging.request	If set to true, the details of the request XML will be saved in the logs. Default value: true	
thomsonreuters.idt.detailedlogging.response	If set to true, the details of the response XML will be saved in the logs. Default value: true	

Base Store Specific Configuration

The configuration properties defined in the table above can be used directly to adjust the behavior system-wide. In case you need to define different behavior for each Base Store in your organization, you can add the base store code as a postfix and override the generic value. Note that not all configuration items support this feature. Please refer to the “Can be Base Store specific?” column in the table above for each item.

Example:

- Suppose you have two base stores running in parallel: storeA and storeB and you have the following items in your local.properties file:
 - thomsonreuters.idt.registration.seller=false
 - thomsonreuters.idt.registration.seller.storeA=true

- In this case, you should expect the following behavior:
 - Seller registrations should be sent for storeA but not for storeB.

DEVELOPMENT AND EXTENSIBILITY

Custom Attributes

ONESOURCE Determination enables companies to submit, and have returned, user-defined elements that are not directly supported in Determination. These elements can be used in conjunction with TransEditors (input filters) to enable custom tax calculations and are stored in the audit table for reporting purposes. Each <USER_ELEMENT> structure contains a single <NAME>/<VALUE> pair.

If you need to use these fields and send in the request payload, you need to extend the capabilities of trtaxintegration extension.

You can achieve this in five steps:

1. Decide on the hierarchy. Customer attributes can be sent either in:
 - a. Header
 - b. Product item
 - c. Delivery cost items
2. In a custom extension add trtaxintegration as a required extension

3. In the custom extension, create a populator class implementing de.hybris.platform.converters.Populator with the following source and target parameters:
 - a. For header attributes:
 - i. source: de.hybris.platform.core.model.order.AbstractOrderModel
 - ii. target: taxcalculationservice.wsdl.IndataType
 - b. For product item attributes:
 - i. source: com.thomsonreuters.idt.integrations.sapcommerce.models.TradtDiscountedOrderEntry
 - ii. target: taxcalculationservice.wsdl.IndataLineType
 - c. For delivery cost item attributes:
 - i. source: de.hybris.platform.core.model.order.AbstractOrderModel
 - ii. target: taxcalculationservice.wsdl.IndataLineType
4. Implement the business logic for each class. Add name/value pairs in taxcalculationservice.wsdl.UserElementType type to the respective structure. Currently restricted to the values ATTRIBUTE2 through ATTRIBUTE50. Note that ATTRIBUTE1 is already used in the standard logic in trtaxintegration extension.
5. Manage dependency injection in {{extension}}-spring.xml file
 - a. Add a new bean for the populator. Ex:
 - i. `<alias name="{{populator bean ID}}> alias="{{populator bean ID}}</alias>`
 - ii. `<bean id="{{populator bean ID}}" class="{{Populator class path}}></bean>`
 - b. Add the populator bean to the converter bean as a dependency

For header attributes:

```

<alias name="{{header converter bean ID}}" alias="tradtOrderConverter" />

<bean id="{{header converter bean ID}}" parent="abstractPopulatingConverter">

<property name="targetClass" value="taxcalculationservice.wsdl.IndataType" />

<property name="populators">

<list>
  
```

```
<ref bean="tridtCommonOrderHeaderPopulator" />  
<ref bean="tridtB2COrderHeaderPopulator" />  
<ref bean="{{populator bean ID}}" />  
</list>  
</property>  
</bean>
```

For item attributes:

```
<alias name="{{item converter bean ID}}" alias="tridtOrderItemConverter" />  
<bean id="{{item converter bean ID}}" parent="abstractPopulatingConverter">  
<property name="targetClass" value="taxcalculationservice.wsdl.IndataLineType" />  
<property name="populators">  
<list>  
<ref bean="tridtOrderItemPopulator" />  
<ref bean="{{populator bean ID}}" />  
</list>  
</property>  
</bean>
```

For delivery cost item attributes:

```
<alias name="{{delivery cost item converter bean ID}}" alias="tridtShippingItemConverter" />  
<bean id="{{delivery cost item converter bean ID}}" parent="abstractPopulatingConverter">  
<property name="targetClass" value="java.util.ArrayList" />  
<property name="populators">  
<list>  
<ref bean="tridtShippingItemPopulator" />
```

```

<ref bean="{{populator bean ID}}" />

</list>

</property>

</bean>

```

Support for Spartacus UI and Omni Commerce Connect (OCC) REST API

The SAP Commerce ONESOURCE integration (estimation calls during checkout) can also be triggered by Omni Commerce Connect (OCC) web service calls. When an update on the cart is received via an OCC call, the system decides whether a new tax call is necessary and performs the call automatically.

Here are some examples that can trigger an external tax call:

- POST - /{baseSiteId}/users/{userId}/carts/{cartId}/addresses/delivery
- PUT - /{baseSiteId}/users/{userId}/carts/{cartId}/deliverymode
- POST/PUT - /{baseSiteId}/users/{userId}/carts/{cartId}/paymentdetails

This feature makes ONESOURCE Determination integration available for the new Spartacus UI.

In addition to that following custom endpoints are added to the available OCC endpoints if you include `trtaxintegrationocc` extension in your setup. These endpoints provide extra tax summary information and can be used in case you decide to customize your checkout, order details and return details pages to provide details about your calculated tax, such as tax value details..

- GET - /{baseSiteId}/{userId}/tax/cart/{cartId}
- GET - /{baseSiteId}/{userId}/tax/order/{orderId}
- GET - /{baseSiteId}/{userId}/tax/returnRequest/{returnRequestId}

LOGGING AND MONITORING

Console Logging

In the lifetime of a single tax call, several log messages are generated by the system and those can be displayed in the standard application log in SAP Commerce. The table below summarizes the logs that should be observed in the logs for an error-free tax call process.

STEP NO	LOG LEVEL	CLASS	TEXT
1	INFO	DefaultTridtTaxCalculationService	Starting ONESOURCE Determination process...
2	DEBUG	TridtSoapLoggingService	<p>Log ID: {1}, ONESOURCE Determination Request XML: {2}: Request XML</p> <p>Note: The message is only activated if <code>thomsonreuters.idt.detailedlogging.request=true</code> and DEBUG log level is activated for class TridtSoapLoggingService</p>
3	DEBUG	TridtSoapLoggingService	<p>Log ID: {1}, ONESOURCE Determination Response XML: {2}</p> <p>{1}: Unique request ID that includes the cart id and the timestamp</p> <p>{2}: Request XML</p> <p>Note: The message is only activated if <code>thomsonreuters.idt.detailedlogging.response=true</code> and DEBUG log level is activated for class TridtSoapLoggingService</p>
4	INFO	DefaultTridtTaxCalculationService	<p>Request stats for ID: {1} , Request Preparation Duration: #{2}#, Response Waiting Duration: ## {3}##, Response Processing Duration: ###{4}###</p> <p>{1}: Unique request ID that includes the cart id and the timestamp</p> <p>{2}: Time passed while preparing the request</p> <p>{3}: Time passed in Determination System processing</p> <p>{4}: Time passed while processing the response</p>

Kibana Dashboards

In SAP Public Cloud Deployments these logs can be displayed in Kibana user interface. As a part of the integration package, three custom dashboards with several metrics and saved searches are provided for monitoring OneSource Determination integration.

Installation Instructions:

- In your trtaxintegration extension, you will find a folder that contains necessary files to import custom dashboards located in resources\kibana path
- The dashboards need three scripted fields to be available in your Index Pattern. Those fields should be created manually
 - Go to Kibana/ Management / Index Patterns / Scripted Fields tab
 - Follow instructions in Tridt_Kibana_ScriptedFields.txt to create three scripted fields
- Import dashboards, visualizations and saved searches
 - Go to Kibana/ Management / Saved Objects and click import
 - Choose “Tridt_Kibana_Customizations.json” located in resources\kibana folder and execute
- Start using your dashboards and saved searches in your SAP Commerce Public Cloud environment.

Note: The dashboards, visualizations and saved searches are based on the logs described in the table above. They will not work properly, if any of these log items are deactivated by setting a lower log level in log4j2.

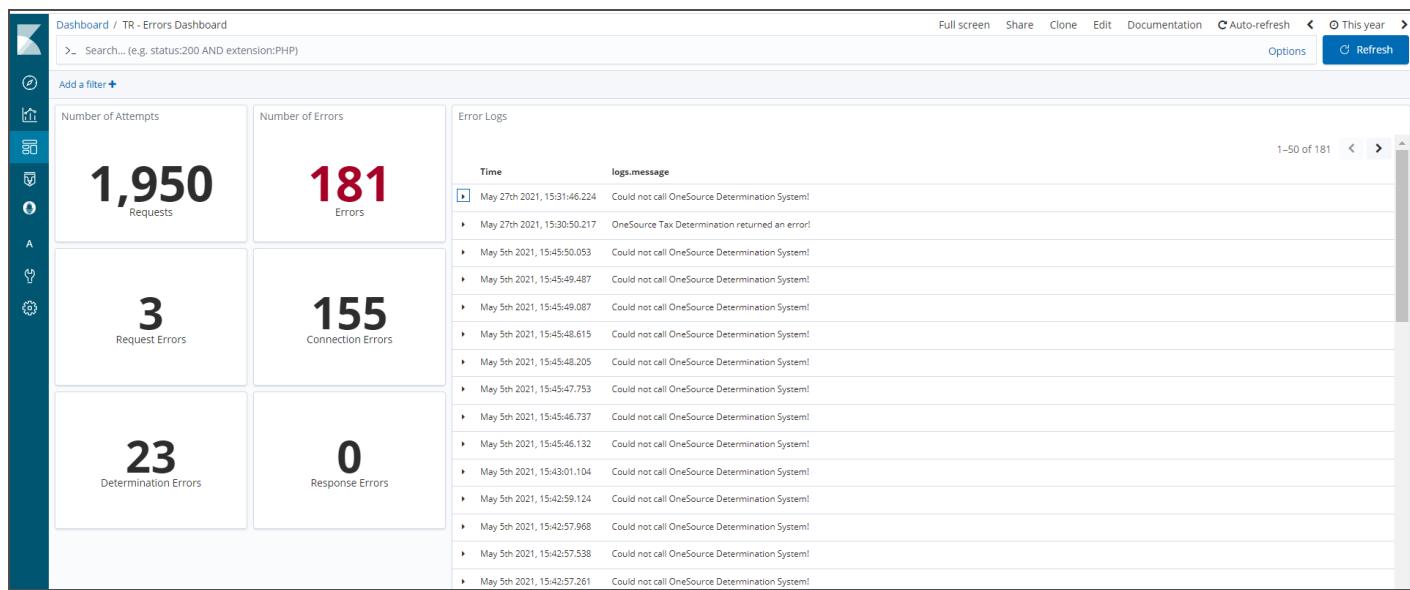

Errors Dashboard:

The dashboard includes several visualizations that focus on tax integration-related errors and their breakdowns in a specified time frame.

The time frame can be set in the upper right section. The dashboard includes the following information:

- The number of tax call attempts
- The total number of errors
- The total number of request preparation related errors.
- The total number of connection errors.

- The total number of errors returned by ONESOURCE Determination.
- The total number of response processing related errors.
- List of all errors

The screenshot shows the ONESOURCE Errors Dashboard. On the left, there is a sidebar with various icons. The main area has a grid of four boxes: 'Number of Attempts' (1,950 Requests), 'Number of Errors' (181 Errors), 'Request Errors' (3), and 'Connection Errors' (155). To the right is a table titled 'Error Logs' with columns 'Time' and 'logs.message'. The table lists 181 entries, with the first few lines being:

Time	logs.message
May 27th 2021, 15:31:46.224	Could not call OneSource Determination System!
May 27th 2021, 15:30:50.217	OneSource Tax Determination returned an error!
May 5th 2021, 15:45:50.053	Could not call OneSource Determination System!
May 5th 2021, 15:45:49.487	Could not call OneSource Determination System!
May 5th 2021, 15:45:49.087	Could not call OneSource Determination System!
May 5th 2021, 15:45:49.615	Could not call OneSource Determination System!
May 5th 2021, 15:45:48.205	Could not call OneSource Determination System!
May 5th 2021, 15:45:47.753	Could not call OneSource Determination System!
May 5th 2021, 15:45:46.737	Could not call OneSource Determination System!
May 5th 2021, 15:45:46.132	Could not call OneSource Determination System!
May 5th 2021, 15:43:01.104	Could not call OneSource Determination System!
May 5th 2021, 15:42:59.124	Could not call OneSource Determination System!
May 5th 2021, 15:42:57.968	Could not call OneSource Determination System!
May 5th 2021, 15:42:57.538	Could not call OneSource Determination System!
May 5th 2021, 15:42:57.261	Could not call OneSource Determination System!

Requests and Responses Dashboard:

The dashboard includes two saved searches for request and response XMLs in a specified time frame. Please note that detailed logging should be activated for having XML messages to be written to the system log.

The time frame can be set in the upper right section.

Details of a single message can be displayed by expanding the details and clicking on the “View Single Document” button.

April 29th 2020, 16:24:40.607 ("timeMillis":158819880605,"thread":"hybrisHTTP22","level":"INFO","loggerName":"com.thomsonreuters.idt.integrations.sapcommerce.soap.client.impl.TridtSoapLoggingService","message":"Log ID: 00007000_2020.04.29.15.24.39, **OneSource Determination Response**

Tip: You can copy a log ID (Ex: 00007000_2020.04.29.15.24.39), go to the Discover page of Kibana and execute a search to display all tax integration relevant logs for a specific call. On the same page, you can also use wildcards to display all logs from multiple tax calls for a single cart (Ex: 00007000_*).

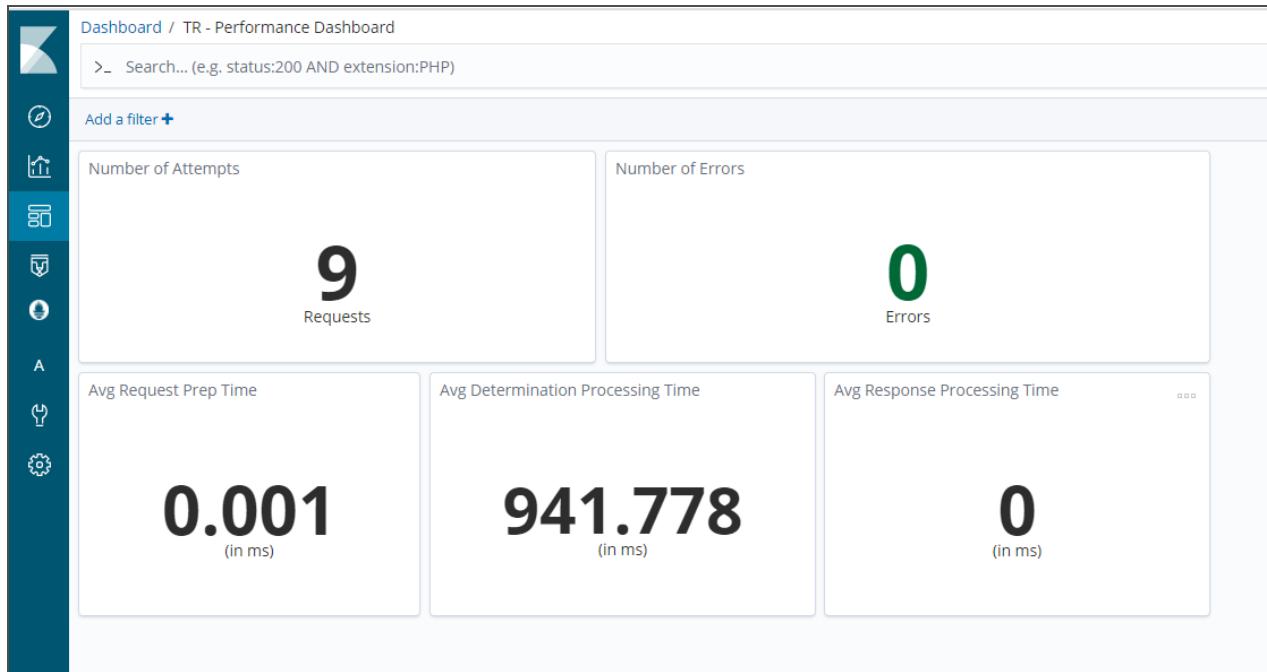

Performance Dashboard

The dashboard includes several visualizations that show critical metrics about the overall status and performance of the integration in a specified time frame.

The time frame can be set in the upper right section. Please note that due to the nature of this dashboard, it is advised to keep intervals shorter to avoid processing errors.

The dashboard includes the following information:

- The number of tax call attempts
- The total number of errors
- Average Request Preparation Time (SAP Commerce)
- Average Determination Processing Time (Connection + Determination Engine)
- Average Response Processing Time (SAP Commerce)

TROUBLESHOOTING SCENARIOS

Classification of Higher-Level Exceptions:

A typical tax call is composed of four different sub-processes and they run one after the other.

Request Preparation → Establishing a connection to Determination → Determination Engine's internal process → Response Processing

In case of an error you can make search logs with the following keywords to understand which part of the process is causing the error.

Once you determine the problematic area, you should look for child exceptions/errors to determine the root cause.

KEYWORD TO SEARCH	SUBPROCESS THAT IS THROWING THE EXCEPTION	RESPONSIBLE SYSTEM
TridtRequestException	Request Preparation	SAP Commerce

TridtConnectionException	Establishing a connection to Determination	SAP Commerce / Determination
TridtDeterminationException	Determination Engine's internal process	Determination
TridtResponseException	Response Processing	SAP Commerce
DefaultExternalTaxesService.saveOrder		
TaxValue.parseTaxValue		

Request Preparation Exceptions

You'll find the following exception in your logs: **TridtRequestException** – “Could not prepare the request for ONESOURCE Determination! Order/Cart/Return Request {1} cannot be converted to a request” where {1} is the document number.

This is a generic exception which indicates that the real problem is in request preparation. You need to investigate logs for further details. Here are some examples of possible errors and their reasons:

EXCEPTION	TEXT	REASON
ConversionException	No External Company Id found for Thomson Reuters Tax integration	thomsonreuters.idt.externalcompanyid system property is missing
IllegalArgumentException	The default Point of Service assigned to the Base Store cannot be null.	BaseStore.defaultDeliveryOrigin field is empty.
IllegalArgumentException	No Ship-from address is assigned to the base store	BaseStore.defaultDeliveryOrigin.address field is empty.
NoSuchMethodException	Dynamic address field fetch failed!	Check thomsonreuters.idt.address.* properties. The value does not correspond to a field in AddressModel
IllegalArgumentException	Field XXX is not a String field!	Check thomsonreuters.idt.address.* properties. The value should be a String typed field in AddressModel

Response Processing Exceptions

You'll find one the following exceptions in your logs:

- **TridtResponseException** – “ONESOURCE Tax Determination response could not be processed! Response processing failed for {1}” where {1} is the document number. This exception indicates that response XML could not be converted into SAP's internal TaxValue structure
- Any exception in **de.hybris.platform.commerceservices.externaltax.impl.DefaultExternalTaxesService.saveOrder** indicates that converted TaxValue's could not be saved into the database.
- Any exception in **de.hybris.platform.util.TaxValue.parseTaxValue** indicates that converted TaxValue's could not be saved into the database.

Those are generic exceptions. You need to investigate logs for further details. Here are some possible errors and their reasons:

EXCEPTION	TEXT	REASON
ConversionException	Tax response is corrupted, conversion not possible	The response XML received, does not have OutdataInvoiceType inside.
NullPointerException	Cannot invoke "java.util.List.isEmpty()" because "lines" is null	The response XML received, does not have OutdataLineType inside.
NullPointerException	Cannot invoke "java.util.List.stream ()" because "taxList" is null	There is no tax value info for a line in the response XML.
NullPointerException	element cannot be mapped to a null key	<p>One of the tax values in the response message doesn't have the necessary key for summarization.</p> <p>Check thomsonreuters.idt.response.summarization system property and check why that field is not coming up from Determination.</p>

DataIntegrityViolationException	<pre>ModelSavingException query; SQL []; String or binary data would be truncated.; nested exception is com.microsoft. sqlserver .jdbc.SQLServerException: String or binary data would be truncated.</pre>	<p>Database table field length for CartEntries.taxValueInternal field is 255 characters long by design. This field is too short to keep all tax values for certain cases. SAP suggests changing the field length by running an "Alter Table" SQL query.</p> <p>In SAP Public Cloud deployments, customers can not perform this operation. You should open an incident to SAP Support, with component CEC-HCS-CCAZ-DBO, and ask SAP to change the length of field p_taxvaluesinternal in table cartentries to 1000 characters.</p>
NumberFormatException	<pre>error parsing tax value string '<TV<XX-XXX #[ATT]sales [ATT]#4.07#true#4.07#USD>VT>': java.lang.NumberFormatException: For input string: "[ATT]sales [ATT]"</pre>	<p>One of the "tax code" for an item possibly includes a special character that is misinterpreted by the SAP Commerce internal logic.</p> <p>Check the response XML for details.</p>

Connection Exceptions

You'll find the following exception in your logs: **TridtConnectionException** – Could not call ONESOURCE Determination System!

This is a generic exception which indicates that the real problem occurred while trying to connect to Determination. You need to investigate logs for further details. Here are some possible errors and their reasons:

This kind of errors mostly occur when the SOAP Request is malformed or contains invalid authentication credentials. The SOAP Response would contain a `<soap: Fault>` element with two (2) child elements `<faultcode>` and `<faultstring>` as shown below:

```

<soap:Envelope xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/">
  <soap:Body>
    <soap:Fault>
      <faultcode
      xmlns:ns1="http://ws.apache.org/wss4j">ns1:SecurityError</faultcode>
      <faultstring>A security error was encountered when verifying the
message</faultstring>
    </soap:Fault>
  </soap:Body>
</soap:Envelope>

```

Here are some examples:

EXCEPTION	TEXT	REASON
SocketException	Connection timed out (Read failed)	<p>Determination failed to send any response. This indicates an internal problem in Determination System.</p> <p>Note: The connection process is backed up with a retry mechanism that resends the message up to a certain number of attempts. Please check thomsonreuters.idt.connection.retry.attempts and thomsonreuters.idt.connection.retry.delay configuration parameters to tweak this behaviour.</p>
WebServiceTransportException	404	Determination system could not be found. Check thomsonreuters.idt.url
SoapFaultClientException	A security error was encountered when verifying the message	<p>Username and password can be wrong. Check thomsonreuters.idt.username and thomsonreuters.idt.password system properties</p>

WebServiceIOException	I/O error: Permission denied: connect: {domain}; nested exception is java.net.SocketException: Permission denied: connect: {domain} where {domain} is the URL domain of Determination Service	Network communication error during integration, check network settings are correct
WebServiceIOException	I/O error: Connection reset; nested exception is javax.net.ssl.SSLException: Connection reset	Network communication error during integration, check network settings are correct

Determination Errors

You'll find one of the following exceptions in your logs:

TridtDeterminationException – “ONESOURCE Tax Determination returned an error! Determination error for id {1} : {2} ” where {1} is the cart number and {2} is the error text returned by the Determination.

This is a generic exception which indicates that the real problem is in request preparation. You need to investigate logs for further details.

Determination Request Errors indicates that the Request was unsuccessful and is indicated on the `<IS_SUCCESS>` child element of the `<REQUEST_STATUS>` element found in the `<OUTDATA>` structure. The `<IS_SUCCESS>` contains a Boolean value (either true or false) indicating the status of the request. When the `<IS_SUCCESS>` value is false, the Integration should indicate to the calling application the request was unsuccessful. Below is a sample Determination Response where the Request is not successful:

```

<soap:Envelope xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/">
  <soap:Body>
    <taxCalculationResponse
      xmlns="http://www.sabrix.com/services/taxcalculationservice/2011-09-01">
      <OUTDATA version="G">
        <REQUEST_STATUS>
          <IS_SUCCESS>false</IS_SUCCESS>
          <IS_PARTIAL_SUCCESS>false</IS_PARTIAL_SUCCESS>
          <ERROR>
            <CODE>COMPANY_NOT_FOUND</CODE>
            <DESCRIPTION>Unknown Company.</DESCRIPTION>
            <ERROR_LOCATION_PATH>/OUTDATA/INVOICE[INVOICE_NUMBER='155']</ERROR_LOCATION_PATH>
          </ERROR>
        </REQUEST_STATUS>
      </OUTDATA>
    </taxCalculationResponse>
  </soap:Body>
</soap:Envelope>

```

The values of <CODE>, <DESCRIPTION> elements within the <ERROR> structure provides further details about the root cause of the error. Here are some possible errors that you might encounter:

TEXT	REASON
COMPANY_NOT_FOUND	External Company ID cannot be found
EUSG67	Seller must register for intra-community supplies Authority: {{EU Country}}

Other Problems:

Sometimes there are no exceptions visible in logs but the tax values are supposed to have a different value. For those cases most of the time you need to focus on Request Preparation and you need to make sure that all relevant tags are included in the message and the values in the request XML are correct. Here are some examples:

AREA	SYMPTOM	SOLUTION
Address	Geocode tag is missing in the request XML	<p>thomsonreuters.idt.address.postalcodeIncludesGeoCode should be set to false and</p> <p>thomsonreuters.idt.address.geocode should point to a String typed field in AddressModel</p>

Address	Format of postal code is wrong	If thomsonreuters.idt.address.postalcodeIncludesGeoCode is true, postalCode field in AddressModel is expected to be in XXXXX-YYYY format where X's are for postal code and Y's are for Geocode
Address	County, city or district fields are missing in request XML	Check properties starting with thomsonreuters.idt.address.county (or city or district). The value should point to a String typed field in AddressModel.
Address	No bill-to address in the request for a B2B customer	<p>The source of Bill-To address depends on how cart is paid.</p> <p>If it is a credit card payment, the bill-to address is searched in the PaymentInfo associated with the cart.</p> <p>If it can't be found, bill-to address is assumed to be the same with the ship-to address and no separate address is added to the tax request.</p> <p>If it is an account payment, the B2BUnit associated with the B2BCustomer is found and B2BUnit.billingAddress field is used to populate address fields.</p> <p>Please check there is no problem in those fields.</p>
Header	Customer number is wrong for a B2B customer	<p>The B2BUnit associated with the B2BCustomer is found and name and uid field is used for customer name and id.</p> <p>Please check there is no problem in those fields.</p>
Response	Wrong summarization level or no summarization carried out at all.	Check thomsonreuters.idt.response.summarization property. Value may be wrong.

System Behavior on Integration Failures

Common Behavior

If there is a connection error, the request will be resent after waiting 1000 ms up to 3 times if necessary.

These parameters can be changed in system configuration (thomsonreuters.idt.connection.retry.delay and thomsonreuters.idt.connection.retry.attempts)

Specific Cases (After Unsuccessful Trials)

Cart

If any error occurs in the integration in checkout while the user is still interacting with the system, two options are possible:

- If `thomsonreuters.idt.fallback.fallbackoncart` is true, `thomsonreuters.idt.fallback.fixedpercentage` value is applied to all items and the delivery cost as a fixed tax rate
- If `thomsonreuters.idt.fallback.fallbackoncart` is false, an exception is thrown. In this case, it is client's responsibility to catch this exception and convert it to a meaningful and appropriate warning message on the storefront.

Order Process

An exception is thrown, and the process fails. After examining the logs and eliminating the error, the order process should be resumed to redo the tax posting.

Backoffice

An exception is thrown, and the operation fails. An error is displayed on the screen. After examining the logs and eliminating the error, the Refresh Tax action should be retriggered.

Return Request

An exception is thrown, and the process fails. After examining the logs and eliminating the error, the return process should be resumed to redo the tax posting.

ADDRESS VALIDATION SERVICE (AVS)

For external address validation call to ONESOURCE AVS to be triggered in the system, the following prerequisites should be met:

- AVS Calls should be activated in system configuration (`thomsonreuters.avs.integration.active=true`)
- External Company ID for AVS should be defined in system configuration
- The user enters a US address in the storefront

AVS Business Process Description

Checkout

During a checkout process both in B2C and B2B storefronts, two address validation requests can be sent to the Address Validation Service in order to validate the address details provided by the user. In this process, the user fills the address form to create a new address in the system and clicks “Next” to proceed to the next step. At this stage, AVS service is called with the form fields. The service can return three different results:

- **Address confirmed:** In this case, the address is saved on the cart (and optionally on the address book of the user) and the next checkout step is displayed afterward.
- **Address corrected:** AVS returns a similar address with some fields corrected. The new address is displayed as a popup to the user. The user can then accept the new address or continue with the old version.
- **Address rejected:** When the address can not be identified by the service, an error is returned by the system together with a reason. The user stays on the address step to make the necessary corrections and the error and the reason are displayed as a notification.

In the checkout step, if the user selects an address from the address book (previously used and stored addresses) the integration will not be triggered.

My Account / Address Book

In the accelerators of SAP Commerce, users can edit their stored addresses in Address Book page under My Account section. When adding a new address or editing an existing one, the same AVS call mentioned above is triggered and the results are processed in a similar way.

AVS Configuration Options

It is possible to change the default integration behavior by providing certain system properties in local.properties file for local installations and manifest.json file SAP Public Cloud Systems. Each option is described below in detail:

KEY	DESCRIPTION
thomsonreuters.avs.integration.active	If true, integration will be active Default value: true
thomsonreuters.avs.addressvalidationservice.url	The value will be provided by Thomson Reuters. Default value: Empty
thomsonreuters.avs.externalcompanyid	The value will be provided by Thomson Reuters Default value: Empty
thomsonreuters.avs.password	The value will be provided by Thomson Reuters Default value: Empty
thomsonreuters.avs.username	The value will be provided by Thomson Reuters Default value: Empty

thomsonreuters.avs.detailedlogging.request	If true, the XML message for the request will be logged Default value: false
thomsonreuters.avs.detailedlogging.response	If true, the XML message for the response will be logged Default value: false
thomsonreuters.avs.integration.connection.errorallowed	If true, in case of connection or system errors, users will be allowed to proceed to the next checkout step Default value: false
thomsonreuters.avs.integration.connection.errormessage	Default value: Address Verification Service is down.

AVS UI Messages

In case of an error, ONESOURCE Address Validation Service returns an explanation text that describes the root cause.

Here are some possible error messages that can be returned by the service:

- Street number or box number out of range
- Please enter a valid address number.
- Street not found
- Please input a street address.
- Address not found
- Multiple addresses match.

In order to display this text in UI to enable the user to make the necessary corrections, certain steps have to be carried out depending on your storefront UI technology.

Accelerator Based UI

travsintegrationaddon extension must be added to your setup. Please refer to section “Architecture and Design Overview” for further details. After the addon is active you should see an extra message when AVS returns an error.

Errors were found with the address you provided. Please check the errors below and re-submit your address.

Address Validation Error: Street not found

Spartacus UI

trtaxintegrationocc extension provides an enhanced version of SAP’s address verification OCC endpoint (POST - /{baseSiteId}/users/{userId}/addresses/verification) which can be access on (POST - /{baseSiteId}/users/{userId}/addresses/travs). This endpoint’s request and response data structure is the same with the original endpoint but it returns the AVS error in the reason field of the response. Here is a sample response from this endpoint:

```
{
  "decision": "REJECT",
  "errors": {
    "errors": [
      {
        "message": "Invalid field: addressline1",
        "reason": "Street not found",
        "subject": "line1",
        "subjectType": "parameter",
        "type": "Validation Error"
      }
    ]
  }
}
```

In your Spartacus project you can replace OCC endpoint for address verification with this enhanced version and customize your page to display the reason field as an error message.

The customizations on Spartacus UI is beyond the scope of this integration package.

AVS Logging and Monitoring

In the lifetime of a single address validation call, several log messages are generated by the system and those can be displayed in the standard application log in SAP Commerce. The table below summarizes the logs that should be observed in the logs for an error-free address validation call process.

STEP NO	LOG LEVEL	CLASS	TEXT
1	INFO	TravsAddressVerificationService	Calling Address Verification Service
2	INFO	TravsSoapLoggingService	<p>Log ID: {1}, Address Verification Service Request XML: {2}</p> <p>{1}: Unique request ID that includes the cart id and the timestamp</p> <p>{2}: Request XML</p> <p>The message is only activated if thomsonreuters.avs.detailedlogging.request =true and DEBUG log level is activated for class TravsSoapLoggingService</p>

3	INFO	TravsSoapLoggingService	<p>Log ID: {1}, Address Verification Service Response XML: {2}</p> <p>{1}: Unique request ID that includes the cart id and the timestamp</p> <p>{2}: Response XML</p> <p>The message is only activated if thomsonreuters.avs.detailedlogging.response =true and DEBUG log level is activated for class TravsSoapLoggingService</p>
4	INFO	TravsAddressVerificationService	<p>Request stats for AddressLine1: {1}, Response Waiting Duration: ##{2}##</p> <p>{1}: ID for the AVS call</p> <p>{2}: Time passed while waiting for the response from the external service</p>

In SAP Public Cloud Deployments these logs can be displayed in Kibana user interface. As a part of the integration package, three custom dashboards with several metrics and saved searches are provided for monitoring ONESOURCE Determination integration.

If an exception occurs during the service call, the root cause will be logged together with this error message: **“Address Verification Service call failed and not completed”**.

For troubleshooting in Kibana, you can use this text to find the error logs and investigate the accompanying exception.

APPENDIX 1: DATA MAPPING

The table below describes the logic behind how SAP Commerce internal data structures are used to generate the Determination Request XML and how Determination Response XML is mapped back to SAP Commerce internal structures.

ONESOURCE DETERMINATION	SAP COMMERCE	
Level	Data Element	Population Logic

Request		
Header - UsernameToken	Username	Configuration: thomsonreuters.idt.username
Header - UsernameToken	Password	Configuration: thomsonreuters.idt.password Will be masked in logs
INDATA	version (attribute of INDATA)	Fixed value Default as 'G'
INVOICE	EXTERNAL_COMPANY_ID	Configuration: BaseStore.tridtExternalCompanyId or thomsonreuters.idt.externalcompanyid
INVOICE	HOST_SYSTEM	Configuration: thomsonreuters.idt.hostsystem
INVOICE	CALLING_SYSTEM_NUMBER	Configuration: thomsonreuters.idt.callingsystemnumber
INVOICE	HOST_REQUEST_INFO / HOST_REQUEST_LOG_ENTRY_ID	This tag is only added to the request if the request is being resent by the retry mechanism in case of a connection error. The value is a string representation for the number of retries.
INVOICE	CALCULATION_DIRECTION	Based on AbstractOrder.net field. True → 'F', False → 'T' Default is 'F'
INVOICE	COMPANY_ROLE	Fixed value Default is 'S'
INVOICE	CURRENCY_CODE	AbstractOrder.currency.isocode
INVOICE	INVOICE_DATE	For carts: Get the current date For Orders: Order.date For returns: ReturnRequest.order.date

INVOICE	INVOICE_NUMBER	For carts: AbstractOrder.code+Timestamp (Timestamp is in yyyy.MM.dd.HH.mm.ss format) For orders: AbstractOrder.code For returns: ReturnRequest.code
INVOICE	IS_AUDITED	true/false For carts; always false For orders; if thomsonreuters.idt.request.audit.auditafterdelivery = false or delivery status is SHIPPED → true, otherwise false For returns; only true if return request status is one of COMPLETED, REVERSING_TAX, REVERSING_PAYMENT, TAX_REVERSED, PAYMENT_REVERSED, TAX_REVERSAL_FAILED, RECEIVED, PAYMENT_REVERSAL_FAILED
INVOICE	IS_CREDIT	Fixed value : true Only for return requests
INVOICE	ORIGINAL_DOCUMENT_ID	Associated order for the return request Only for return requests
INVOICE	ORIGINAL_INVOICE_DATE	The date for the associated order Only for return requests
INVOICE	TAX_DETERMINATION_DATE	The date for the associated order Only for return requests
INVOICE	TRANSACTION_TYPE	Fixed value Default as 'GS'
INVOICE	CUSTOMER_NUMBER	In B2C: AbstractOrder.user.uid In B2B: B2BUnit is found based on AbstractOrder.user and B2BUnit.uid is sent

INVOICE	CUSTOMER_NAME	Only valid in B2B scenarios B2BUnit is found based on AbstractOrder.user and B2BUnit.name is sent
INVOICE	DELIVERY_TERMS	Either AbstractOrder.deliveryMode.tridtIncoterm or first 10 characters of AbstractOrder.deliveryMode.code Will be used only if thomsonreuters.idt.request.b2b.senddeliverymodeasincoterm=true
INVOICE	REGISTRATIONS / SELLER_ROLE	If thomsonreuters.idt.registration.seller=true, BaseStore.tridtTaxRegistrationNumbers are added to the list
INVOICE	REGISTRATIONS / BUYER_ROLE	If thomsonreuters.idt.registration.buyer=true, B2BUnit.tridtTaxRegistrationNumbers are added to the list
INVOICE	SHIP_FROM	BaseStore.defaultDeliveryOrigin.address The AddressModel found will be the basis to fill the address fields described below
INVOICE	SHIP_TO	AbstractOrder.deliveryAddress The AddressModel found will be the basis to fill the address fields described below
INVOICE	BILL_TO	In B2C scenarios: Check AbstractOrder.paymentInfo.billingAddress, if not null use this address. If null, no Bill-To element is sent In B2B scenarios: Check AbstractOrder.paymentInfo, if it is a Credit Card, then the same as B2C, otherwise find B2BUnit associated with the user and send B2BUnit.billingAddress The AddressModel found will be the basis to fill the address fields described below

INVOICE	ORDER_ACCEPTANCE	<p>Check system property thomsonreuters.idt.request.address.sendorderacceptanceaddresses</p> <p>If the property is true, BaseStore.tridtOrderAcceptanceAddress will be sent.</p> <p>The AddressModel found will be the basis to fill the address fields described below</p>
INVOICE	ORDER_ORIGIN	<p>If activated by thomsonreuters.idt.request.address.sendorderoriginaddress:</p> <p>In B2C scenarios, will be the same as BILL_TO or SHIP_TO if the others are not available.</p> <p>In B2B scenarios, B2BUnit.contactAddress will be sent if found. If not, it will be the same as BILL_TO or SHIP_TO if the others are not available.</p> <p>The AddressModel found will be the basis to fill the address fields described below</p>
INVOICE	SELLER_PRIMARY	<p>Check system property thomsonreuters.idt.request.address.sendsellerprimary</p> <p>If the property is true, BaseStore.tridtOrderAcceptanceAddress will be sent.</p> <p>The AddressModel found will be the basis to fill the address fields described below</p>
INVOICE	BUYER_PRIMARY	<p>If activated by thomsonreuters.idt.request.address.sendorderoriginaddress:</p> <p>In B2C scenarios, will be the same as BILL_TO or SHIP_TO if the others are not available.</p> <p>In B2B scenarios, B2BUnit.contactAddress will be sent if found. If not, it will be the same as BILL_TO or SHIP_TO if the others are not available.</p> <p>The AddressModel found will be the basis to fill the address fields described below</p>

ADDRESS	COUNTRY	Address.country.isoCode
ADDRESS	STATE	Address.region.isoCodeShort
ADDRESS	STATEPROVINCE	Address.region.isoCodeShort Only for Canadian addresses
ADDRESS	COUNTY	Address.(field) field is determined based on thomsonreuters.idt.address.county
ADDRESS	CITY	Address.(field) field is determined based on thomsonreuters.idt.address.city
ADDRESS	DISTRICT	Address.(field) field is determined based on thomsonreuters.idt.address.district
ADDRESS	POSTCODE	Address.postalcode field value may be stripped based on thomsonreuters.idt.address.postalcodeIncludesGeoCode
ADDRESS	GEOCODE	Address.postalcode or Address.(field) Please check Configuration Options for the following system properties: thomsonreuters.idt.address.postalcodeIncludesGeoCode thomsonreuters.idt.address.geocode
LINE	ID	AbstractOrderEntry.entryNumber
LINE	LINE_NUMBER	AbstractOrderEntry.entryNumber

LINE	PRODUCT_CODE / COMMODITY_CODE	<p>-Please check Configuration Options for the following system properties:</p> <p>thomsonreuters.idt.request.item.sendCommodityCode</p> <p>thomsonreuters.idt.request.item.taxcode.enhancedsearch.producthierarchy.enabled</p> <p>thomsonreuters.idt.request.item.taxcode.enhancedsearch.categorhierarchy.enabled</p> <p>thomsonreuters.idt.request.item.taxcode.fallbackCode</p>
LINE	PART_NUMBER	AbstractOrderEntry.product.code
LINE	DESCRIPTION	AbstractOrderEntry.product.name
LINE	GROSS_AMOUNT	<p>Used if AbstractOrder.net = true</p> <p>AbstractOrderEntry.TotalPrice + AbstractOrderEntry.DiscountValues</p>
LINE	GROSS_PLUS_TAX	<p>Used if AbstractOrder.net = false</p> <p>AbstractOrderEntry.TotalPrice + AbstractOrderEntry.DiscountValues</p>
LINE	DISCOUNT_AMOUNT	Propoertionally distributed AbstractOrder.DiscountValues + AbstractOrderEntry.DiscountValues
LINE	AMOUNT	AbstractOrderEntry.quantity
LINE	UOM	AbstractOrderEntry.unit
LINE	SHIP_TO	<p>AbstractOrderEntry.deliveryPointOfService.address or AbstractOrderEntry.deliveryAddress</p> <p>Only if it is a pickup item or if the item delivery address is not empty</p>
LINE	SHIP_FROM	<p>AbstractOrderEntry.deliveryPointOfService.address</p> <p>Only if it is a pickup item</p>

LINE	DELIVERY_TERMS	AbstractOrderEntry.deliveryMode.code Only valid in B2B scenarios Will be used only if item delivery mode is not empty and thomsonreuters.idt.request.b2b.senddeliverymodeasincoterms=true
LINE (DELIVERY)	ID	Last entry number + 1
LINE (DELIVERY)	LINE_NUMBER	Last entry number + 1
LINE (DELIVERY)	PRODUCT_CODE / COMMODITY_CODE	thomsonreuters.idt.deliveryitem Please check Configuration Options for the following system properties: thomsonreuters.idt.request.item.sendCommodityCode thomsonreuters.idt.request.shipping.productcode
LINE (DELIVERY)	GROSS_AMOUNT	Used if AbstractOrder.net = true AbstractOrder.deliveryCost or a calculated value if thomsonreuters.idt.request.shipping.sendmultipledeliverycostitems=true
LINE (DELIVERY)	GROSS_PLUS_TAX	Used if AbstractOrder.net = false AbstractOrder.deliveryCost or a calculated value if thomsonreuters.idt.request.shipping.sendmultipledeliverycostitems=true
LINE (DELIVERY)	OVERRIDE_AMOUNT	With Country, State, County, City, District, Postal code breakdown Used only if the delivery cost is being refunded in return request
LINE (DELIVERY)	AMOUNT	Fixed value Default as '1'

LINE (DELIVERY)	RELATED_LINE_ NUMBER	Associated entry number (Only if thomsonreuters.idt.request.shipping.sendmultipledeliverycostitem s) Not used for Returns
LINE (DELIVERY)	USER_ ELEMENT/ATTRIB UTE1	Fixed value Default is 'X' Flag to differentiate shipment lines from product lines, used in response processing
Response		ExternalTaxDocument/target/lineItemTaxes/TaxValue for product lines and ExternalTaxDocument/target/shippingCostTaxes/TaxValue for shipment lines
INVOICE/LINE/ TAX	AUTHORITY_ NAME / ERP_TAX_ CODE / AUTHORITYTYPE / EFFECTIVEZONEL EVEL	Code ONESOURCE field is selected based on thomsonreuters.idt.response.summarization
INVOICE/LINE/ TAX	TAX_ AMOUNT/AUTHOR ITY_AMOUNT	Value Value is calculated based on thomsonreuters.idt.response.summarization. If summarization is requested, several TAX_AMOUNT/AUTHORITY_AMOUNT's are summed up based on the summarization level
INVOICE/LINE/ TAX	-	Absolute Always false. SAP Commerce does not accept rates as external tax
INVOICE/LINE/ TAX	TAX_ AMOUNT/AUTHOR ITY_AMOUNT	appliedValue Same as value
INVOICE	CURRENCY_ CODE	currency

INVOICE/LINE/ TAX	AUTHORITY_ NAME / ERP_TAX_ CODE / AUTHORITYTYPE / EFFECTIVEZONELEVEL	Code ONESOURCE field is selected based on thomsonreuters.idt.response.summarization, thomsonreuters.idt.response.shipping.prefix is added as a prefix to the determined value.
INVOICE/LINE/ TAX	TAX_ AMOUNT/AUTHORITY_AMOUNT	Value Value is calculated based on thomsonreuters.idt.response.summarization. If summarization is requested several TAX_AMOUNT/AUTHORITY_AMOUNTs are summed up based on the summarization level
INVOICE/LINE/ TAX	-	Absolute Always false. SAP Commerce does not accept rates as external tax
INVOICE/LINE/ TAX	TAX_ AMOUNT/AUTHORITY_AMOUNT	appliedValue Same as value
INVOICE	CURRENCY_ CODE	currency

APPENDIX 2: AVS DATA MAPPING

The table below describes the logic behind how SAP Commerce internal data structures are used to generate the Determination Request XML and how Determination Response XML is mapped back to SAP Commerce internal structures.

ONESOURCE DETERMINATION		SAPCOMMERCE
Level	Data Element	Attribute
Request		
Header - UsernameToken	Username	Configuration: thomsonreuters.avs.username

Header - UsernameToken	Password	Configuration: thomsonreuters.avs.password Will be masked in logs
ValidateAddressRequest	ExternalCompanyId	Configuration: thomsonreuters.avs.externalcompanyid
Address	Address1	Address field form filled by the user
Address	Address2	Address field form filled by the user
Address	City	Address field form filled by the user
Address	Region	Address field form filled by the user
Address	Postal Code	Address field form filled by the user
Address	Country	Address field form filled by the user
Response		
RequestStatus	Status	Status of the call SUCCESS or ERROR
AddressResponse	Status	Status of the validation CONFIRMED, CORRECTED or ERROR
ResponseAddress	Address1	Corrected value returned by the service
ResponseAddress	Address2	Corrected value returned by the service
ResponseAddress	City	Corrected value returned by the service
ResponseAddress	Region	Corrected value returned by the service
ResponseAddress	Postal Code	Corrected value returned by the service
ResponseAddress	Country	Corrected value returned by the service
